

Choosing a RabbitMQ exchange type in Warren.

A fanout exchange broadcasts every message to every worker, which self-selects via `should_process`. Use it for linear pipelines where adding a worker should not require touching any routing.

A topic exchange routes by a key. Use it when inputs are mixed and each kind needs a different worker: PDFs to a PDF parser, HTML to an OCR worker, and so on. The broker filters; workers do not.

A direct exchange with a per-job routing plan lets different jobs take different paths through the same deployed workers.
